Re: Fluorouracil 250mg capsules deletion

Kindly note that Fluorouracil 250mg capsules have been deleted from the Government Formulary.

Fluorouracil is used to treat a number of solid tumours, including gastrointestinal tract cancers and breast cancer. However, it is usually given intravenously because absorption following oral administration is unpredictable. Fluorouracil may also be used topically for certain malignant and premalignant skin lesions. The injections and cream of fluorouracil will still be available within the Government Formulary.

For your information please,

Dr R Busuttil
Director General (Health)
